Sender Policy Framework

A host's Sender Policy Framework (SPF) describes who can send mail on its behalf. This is done by publishing an SPF record containing a series of [rules](#). Each rule consists of a qualifier followed by a specification of which domains to apply this qualifier to. For more information please see [openspf.org](#).

Qualifier Mechanism Argument

+ (Pass)	ip4	158.48.35.1
+ (Pass)	ip4	158.48.154.101

+ (Pass)	ip4	158.48.34.29
- (Fail)	all	

Modifiers extend the functionality of SPF records. The most common one is the redirect which indicates another host contains the SPF record being searched for.

Modifier Argument

DMARC

DMARC (Domain-based Message Authentication, Reporting and Conformance) is a mechanism for domain owners to indicate how mail purporting to originate from their domain should be authenticated. It builds on SPF and DKIM, providing a method to set policy and to give reporting of failures. For more information please see [dmarc.org](#).

Raw DMARC record:

v=DMARC1; p=none; fo=1; rua=mailto:dmarc_agg@auth.returnpath.net; ruf=mailto:dmarc_afrf@auth.returnpath.net

Tag	Field	Value
p=none	Requested handling policy	None: no specific action to be taken regarding delivery of messages.
fo=1	Failure reporting options	Generate a DMARC failure report if any underlying authentication mechanism failed to produce an aligned "pass" result.
rua=mailto:dmarc_agg@auth.returnpath.net	Reporting URI(s) for aggregate data	dmarc_agg@auth.returnpath.net
ruf=mailto:dmarc_afrf@auth.returnpath.net	Reporting URI(s) for failure data	dmarc_afrf@auth.returnpath.net

Web Trackers

Web Trackers are third-party resources loaded onto a webpage. Trackable resources include social sharing widgets, javascript files, and images. These trackers can be used to monitor individual user behaviour across the web. Data derived from these trackers are primarily used for advertising or analytics purposes.
